
COMP232 – Data Structures & Problem Solving
Fall 2024

Homework #4
Binary Trees
[45 points]

Note: Answer #1 and #2 here. When you have completed all parts of this homework, save this document as PDF by creating a folder named “noncode-answers” in your git repository for this homework assignment, then push your code to GitHub. Complete the rest of the questions in Eclipse and push to GitHub.

1. Answer the questions below with respect to the following binary tree using the definitions from the text:

- a. What value is at the root of the tree? -> **8**
- b. What values are in leaves of the tree? -> **1, 4, 7, and 13**
- c. What values are in internal nodes of the tree? -> **8, 3, 6, 10 and 14**
- d. What values are descendants of 3? -> **1, 6, 4, and 7**
- e. What values are ancestors of 7? -> **They are 6, 3, and 8**
- f. What is the depth of node 6? -> **It is 2**
- g. What is the height of the tree? -> **It is 3**
- h. What is the path length from 8 to 4? -> **It is 3**
- i. List the node values in the order they would be visited by:
 - i. An inorder traversal. **1 -> 3 -> 4 -> 6 -> 7 -> 8 -> 10 -> 13 -> 14**
 - ii. A preorder traversal. **8 -> 3 -> 1 -> 6 -> 4 -> 7 -> 10 -> 14 -> 13**
 - iii. A postorder traversal. **1 -> 4 -> 7 -> 6 -> 3 -> 13 -> 14 -> 10 -> 8**
 - iv. A levelorder traversal. **8 -> 3 -> 10 -> 1 -> 6 -> 14 -> 4 -> 7 -> 13**

2. Assuming the variable `node` refers to a `BTNode` and that the tree is always sufficiently large, give a statement that identifies the `node`'s:

(I am using the given binary tree in the first exercise for my examples)

a. leftmost grand child.

⇒ To find the leftmost grandchild, we look at the left child of the left child of a node.

For example, the left child of 8 is 3, and the left child of 3 is 1. Since 1 has no children, 1 is the leftmost grandchildren of node 8.

b. great grandparent.

⇒ The great grandparent of a node is the parent of the node's grandparent.

For example, the node is 4, the parent of 4 is 6, the parent of 6 is 3, and the parent of 3 is 8. Therefore, the great grandparent of 4 is 8.

c. left child of right sibling,
assuming node is a left child.

⇒ We first must find a right sibling, which is the right child of the same parent as the current node. Then, the next step is to find the left child, which is the left node under the found right sibling.

For example, say the current node is 1, so its right sibling is 6 and the left child of it is 4. So the left child of right sibling of 1 is 4.

3. Complete the implementation of the `MinKeyFinder` class in the `hw04` package. The `No3Tests` class contains tests that you can use to check your implementation of this class.

(I committed and pushed my code)

4. Implement the `main` method in the `MinKeyFinder` class in the `hw04` package so that it creates a tree with at least 10 nodes and uses a preorder traversal with your visitor to print the key associated with the minimum value in the tree.

(I committed and pushed my code)

5. Complete the implementation of the `visitInOrder` method in the `CS232LinkedBinaryTree` class in the `hw04` package. The `No5Tests` class contains tests that you can use to check your implementation of this method.

(I committed and pushed my code)

6. Complete the implementation of the three-argument constructor for the `CS232LinkedBinaryTree` class in your `hw04` package. The `No6Tests` class contains tests that you can use to check your implementations of this constructor.

(I committed and pushed my code)

7. Complete the implementation of the `contains` method in the `CS232LinkedListBinaryTree` class in the `hw04` package. The `No7Tests` class contains tests that you can use to check your implementations of this method. For full credit, implement `contains` so that it does not rely on the `get` or `getNodeFromSubtree` methods. Instead, add a helper method `subtreeContains` that returns a boolean value. This will be similar to the `getNodeFromSubtree` method. Then call `subtreeContains` from `contains`. Yes, this introduces repeated and unnecessary code, but the point here is not producing the most effective class, but for you to practice writing methods like this.

(I committed and pushed my code)

8. Complete the implementation of the `add` method in the `CS232LinkedListBinaryTree` class in the `hw04` package. The `No8Tests` class contains tests that you can use to check your implementations of this method.

(I committed and pushed my code)=

9. Complete the implementation of the `countLeafNodes` method in the `CS232LinkedListBinaryTree` class in the `hw04` package. The `No9Tests` class contains tests that you can use to check your implementations of this method.

(I committed and pushed my code)
